WHAT IS BEING MEASURED?

Enterococci are a type of bacteria normally present in the human intestines and in the environment. These bacteria can sometimes cause infections. Vancomycin is an antibiotic that is often used to treat these infections. VRE are enterococci that have become resistant to Vancomycin.

The VRE Blood Stream Infection Rate is a quality indicator of the effectiveness of infection control practices. Examples of those practices include: staff hand hygiene compliance and environmental cleaning. It is calculated using the number of hospital acquired VRE Blood Stream Infections that meet a Ministry of Health and Long Term Care (MoHLTC) definition relative to the number of patient days.

WHY IS THIS IMPORTANT?

The VRE rate is a mandatory publicly reported safety measure for Ontario hospitals. VRE blood stream infections can be life threatening as there are few antibiotics available to treat those infections.

WHAT IS THE TARGET?

Bluewater Health aims for a hospital acquired VRE Blood Stream Infection Rate of zero.

HOW ARE WE DOING?

We have maintained a rate of zero since reporting began in 2008.

WHAT ACTIONS ARE WE TAKING?

Regular auditing is underway to improve hand hygiene compliance and to ensure environmental cleaning practices remain aligned with applicable standards.
